

Over the past few decades, technological advancement has played a significant role in the enhancement of global trade, thus in turn increasing the need for awareness and skills in financial management with the aim of achieving adaptive development of solutions to crises in the global economy. Essentially, my interest in finance can be directly linked to my decision to study Business in high school. However, my parents' involvement in the management of the family business also served as a major contributor towards my final decision to further my studies in Finance and Accounting. This final decision was driven by my determination to enhance my comprehension of the factors which determine the success or failure of various organisations. Consequently, the path to becoming a fully fledged Accountant forms the basis of my passion for Finance and Accounting. In the long run, I aspire to utilise my knowledge and experience to enhance crisis avoidance as the CEO (Chief Executive Officer) of my own business.

Before I developed an interest in Finance, I was deeply passionate about the analysis and solution of Mathematical problems. In this case, my passion was driven by an intrigue in the diversity of industrial applicability of Mathematical problems, ideas, rules and abstract models in the business sector. More specifically, I honed my numeracy skills through Mathematical studies at the A-Level, during which I obtained further knowledge on the precepts of Accounting and Finance. I also enrolled in Finance Essential courses provided by Imperial College London in order to develop a better comprehension of issues in Finance. During these online courses, I was particularly keen on lectures which described the relationship between the global financial recession and various principles in accounting. This description revealed the pertinence of accounting to security in finance, thus serving to further cultivate my interest in pursuing further studies in Finance and Accounting.

My overall comprehension of the applicability of Finance, particularly in the Health sector, was enhanced by my experience working at a veterinary clinic last summer. During this placement, I engaged in a number of administrative management tasks such as the filing of records on clients. Such engagements were geared towards allowing seamless healthcare service provision. As such, I developed skills such as keenness to detail, and resource management particularly within public organisations. Consequently, this contributed towards my interest in the establishment of a career in Finance and Accounting within the public sector.

My last Summer holiday also featured weekly volunteer work with Age International at local establishments. During this period, while I met and befriended a number of elderly individuals, I was particularly close to a sweet elderly lady who was initially alienated from social interaction due to the absence of living relatives or close friends. In a sense, I learnt a lot about the importance of hard work, respect and honour from the stories she shared about her past experiences. The quality of hard work was further facilitated by my involvement in volunteer community environmental cleaning on a monthly basis, during which I gained a number of service-based awards. Consequently, these experiences have factored greatly in cementing my focus on pursuing a career in Finance and Accounting, with the aim of ensuring societal financial security.

Generally, in addition to effective management, the ultimate success of businesses is also directly dependent on financial strategies based on accounting. As such, with the increasing necessity for professionals in Finance, a career in this field would be highly rewarding due to its overall allowance for the application of important skills and knowledge. Ultimately, I believe that I possess the passion, motivation, flexibility, and mental capabilities that are necessary for success in Finance and Accounting.
